

DESCRIPTION

Heterocyclic Compounds, Their Production and Use

TECHNICAL FIELD

5 The present invention relates to heterocyclic
compounds, their production and use, ~~and the compounds~~ ^{which compounds}
suppress cell toxicities caused by β -amyloid protein,
protect nerve cells, and are useful for preventing
and/or treating neurodegenerative diseases by
10 protecting nerve cells from other inducers of cell death.

BACKGROUND ART

Neurodegenerative diseases are progressive
disorders that cause fatal damage ^{to} nerve cell death.
15 As principal neurodegenerative diseases, known are
Alzheimer's disease, Parkinson's disease, amyotrophic
lateral sclerosis (ALS), Huntington's chorea,
peripheral nervous system disorders such as typically
diabetic neuropathy, etc. Most of those are related to
20 aging, and, in fact, cases that present the symptoms of
those diseases increase with aging. However, middle-
aged and even young-aged cases may often present the
symptoms of those diseases.

As a result of studies relating to the structure
25 and function of brains, the roles of neurotransmitters
and neurotrophins are being gradually clarified, but ~~for the~~
most part ~~of~~ the causes of neurodegenerative diseases
are still unknown. Only for Parkinson's disease, ^{has} the
relation between it and a specific neurotransmitter,
30 dopamine has been clarified. L-dopa, which is a
precursor of dopamine, is used as a medicine for
Parkinson's disease. L-dopa relieves the neuropathic
manifestation of Parkinson's disease, and maintains
function. However, L-dopa ^{does} ~~could~~ not suppress the
35 progress of neurodegeneration in cases of Parkinson's
disease, and it gradually loses its potency with the

progress of the manifestation of the disease, or that is, with the degeneration and death of dopamine-based nerve cells. Alzheimer's disease results in the degeneration and death of many types of nerve cells such as acetylcholine-based nerve cells and monoamine-based nerve cells. For this disease, some cholinesterase inhibitors are commercially available and some others are in the development stage. However, those are still within the range of symptomatic treatment for temporarily relieving the neuropathic manifestation of Alzheimer's disease, like L-dopa for Parkinson's disease.

As has been mentioned above, no medicines have been reported for protecting nerve cells from the toxicity of factors causing cell death thereby to suppress the progress of neurodegenerative diseases including Alzheimer's disease and Parkinson's disease.

It is said that the cell death in neurodegenerative diseases is caused by the toxicity of factors that are intrinsic to the respective diseases. For Alzheimer's disease, for example, it is believed that the intrinsic β -amyloid in the disease is a factor which to cause cell death. β -amyloid is a protein seen in the brains of cases of Alzheimer's disease, ~~and this~~ constitutes senile lentiginos that are characteristic of the disease in neuropathology, and is composed of from 40 to 43 amino acids. It has been clarified that, when β -amyloid is added to the primary culture of hippocampus nerve cells, this kills the cells (see Science, Vol. 245, pp. 417-420, 1989); and it has been reported that the coagulation of β -amyloid is indispensable for the expression of its toxicity (see Neurobiology of Aging, Vol. 13, pp. 587-590, 1992; and Journal of Molecular Biology, Vol. 218, pp. 149-163, 1991). For the toxicity expression mechanism of β -

amyloid, the following (1) to (4) may be taken into consideration: (1) β -amyloid forms ion channels, through which calcium ions run into nerve cells. (2) β -amyloid promotes the generation of free radicals.

- 5 (3) β -amyloid activates tau-protein kinase I (TPK-I) whereby phosphorylation of tau is promoted. (4) β -amyloid activates microglia, which thereby secretes neurotoxin. However, no one has as yet ~~obtained the~~ ^{confirmed this} ~~conclusion.~~

- 10 Recently, it has been clarified that neurotrophins such as IGF-1 (insulin-like growth factor) and NGF (nerve growth factor) inhibit the apoptosis of nerve cells by β -amyloid or the like, and that, for its mechanism, the apoptosis inhibition is related to the
- 15 inhibition of TPK-I/GSK-3 β (glycogen synthase kinase 3) through activation of PI-3 kinase (see J. Neurosci., Vol. 11, pp. 2552-2563, 1991; Science, Vol. 267, pp. 2003-2006, 1995; and J. Biol. Chem., Vol. 272, pp. 154-161, 1997). When PI-3 kinase is inhibited by β -amyloid
- 20 and TPK-I/GSK-3 β is activated, then pyruvate dehydrogenase (PDH) is inhibited, while having an influence on the synthesis of acetylcholine, to thereby lower the acetylcholine content. This is supported by the decrease in the acetylcholine content of the brains
- 25 of cases of Alzheimer's disease. On the contrary, when PI-3 kinase is activated, then it is expected that not only the nerve cell death is prevented but also the intracerebral acetylcholine content is increased to improve the nervous system condition. In addition, it
- 30 is also expected that the inhibition of TPK-I/GSK-3 β results in the increase in the intracerebral glucose utilization which is lowered in cases of Alzheimer's disease (see J. Biol. Chem., Vol. 269, pp. 3568-3573, 1994; and Endocrinology, Vol. 125, pp. 314-320, 1989).

Accordingly, low-molecular compounds having good permeability to the brain and having neurotrophic action may inhibit nerve cell death in cases of neurodegenerative diseases such as Alzheimer's disease, while improving the nervous system condition in those cases.

20 The starting compounds for compound (I) include their salts, which are not specifically defined provided that the reaction with those salts gives the intended products. The above salts include, for example, the salts of compound (I) above.

25 For configurational isomers (E- and Z-forms) of compound (I), they may be isolated and purified through any ordinary separation means of, for example, extraction, recrystallization, distillation, chromatography and the like, to give pure products in
30 any time when the isomers are formed. By the methods described in "Shin Jikken Kagaku Kouza (New Edition of Lectures of Experimental Chemistry)" 14, edited by the Chemical Society of Japan, pp. 251-253, and in Fourth Edition of "Shin Jikken Kagaku Kouza (Lectures of
35 Experimental Chemistry)" 19, edited by the Chemical Society of Japan, pp. 273-274, or analogous methods thereto, the products of compound (I) being produced

are specifically isomerized at the position of the double bond by heating, or with acid catalysts, transition metal catalysts or radical species catalysts, or through exposure to light, or with strong base catalysts or the like, to thereby obtain the intended pure isomers.

Compound (I) includes stereoisomers, depending on the type of the substituents therein, and both single isomers and mixtures of different isomers are within the scope of the present invention.

Compounds (I) and (Ia) may be in any form of their hydrates and non-hydrates.

In any case, products formed in the reaction mixtures may be subjected to deprotection, acylation, alkylation, hydrogenation, oxidation, reduction, chain extension, substituents-exchange reaction and combined reactions thereof, to obtain compound (I).

Where the products are formed in their free form in the reaction, they may be converted into their salts in any ordinary manner. Where they are formed in the form of their salts, they may be converted into free compounds or other salts in any ordinary manner. The thus-obtained compound (I) may be isolated and purified from the reaction mixtures through any ordinary means of, for example, trans-solvation, concentration, solvent extraction, fractionation, crystallization, recrystallization, chromatography and the like.

Where compound (I) exists in the reaction mixtures in the form of its configurational isomers, diastereomers, conformers or the like, they may be optionally isolated into single isomer through the separation and isolation means mentioned above. Where compound (I) is in the form of its racemates, they may be resolved into d- and l-forms through any ordinary optical resolution.

As compound (I) of the present invention and compound (Ia) have an suppressive effect on neurodegeneration, an activity of suppressing nerve cell death to be caused by β -amyloid, and an activity of neurotrophic factors, while having low toxicity and few side effects, they are useful as medicines.

Compound (I) of the present invention and compound (Ia) act on mammals (e.g., mouse, rat, hamster, rabbit, feline, canine, bovine, sheep, monkey, human, etc.) as neurodegeneration inhibitors and neurotrophic factor-like substances, or as β -amyloid toxicity inhibitors, and suppress the nerve cell death in those mammals. In addition, as having an activity of activating cholinergic neurons (e.g., elevation of choline acetyltransferase activity, etc.), compounds (I) and (Ia) increase the acetylcholine content of subjects to which they are administered while activating the function of the central nervous systems of the subjects. Accordingly, compounds (I) and (Ia) are effective for neurodegenerative diseases (e.g., Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis (ALS), Huntington's chorea, etc.), peripheral nervous system disorders (e.g., diabetic neuropathy, etc.) and the like, and are used as medicines for preventing and/or treating those diseases and disorders.

As their toxicity is low, compound (I) of the present invention and compound (Ia) are, either directly as they are or after having been formulated into pharmaceutical compositions along with pharmaceutically acceptable carriers in any *per se* known manner, for example, into tablets (including sugar-coated tablets, film-coated tablets), powders, granules, capsules (including soft capsules), liquid preparations, injections, suppositories, sustained release preparations, cataplasms, chewing gums, etc., safely administered orally or parenterally (e.g.,

locally, rectally, intravenously, etc.). In the pharmaceutical composition of the present invention, the amount of compound (I) or (Ia) is from 0.01 to 100 % by weight or so of the total weight of the composition. The dose of the composition varies, depending on the subject to which the composition is administered, the administration route employed, the disorder of the subject, etc. For example, for the peroral composition for treating Alzheimer's disease, its dose to adults may be from 0.1 to 20 mg/kg of body weight or so, preferably from 0.2 to 10 mg/kg of body weight or so, more preferably from 0.5 to 10 mg/kg of body weight or so, in terms of the active ingredient of compound (I) or (Ia), and this may be administered once or several times a day. Compounds (I) and (Ia) may be combined with any other active ingredients, for example, cholinesterase inhibitor (e.g., Aricept (donepezil), etc.), brain function activator (e.g., idebenone, vinpocetine, etc.), medicine for Parkinson's disease (e.g., L-dopa, etc.), neurotrophic factors, and so forth. For example, compound (I) or (Ia) is mixed with any of those other active ingredients in any known manner, and formulated into one pharmaceutical composition (for example, in the form of tablets, powders, granules, capsules including soft capsules, liquid preparations, injections, suppositories, sustained-release preparations, etc.); or they may be formulated into separate compositions and administered to the same subject simultaneously or at time intervals.

b) Test Method

(1) Cultivation of SK-N-SH cells

SK-N-SH cells were sub-cultured in DMEM/F12 medium containing 5 % FCS, 0.5 % N2 supplementTM, 1 % of
10 mixture of penicillin (5000 U/mL) and streptomycin (5 mg/mL), under 10 % CO₂ and 90 % air, using CO₂ incubator. At sub-confluent condition, cells were harvested from culture flask with PBS(-) containing 2.5 mM EDTA, and plated at a density of 1.0 x 10⁴ cells/100 μ l of
15 culture medium/well in collagen-coated 96-well multi-plate. The next day, 80 μ l of culture medium was substituted with DMEM/F12 medium (containing neither FCS nor N2 supplement) containing 1.25 ng/mL of rhIFN- γ , and after 24 hr cultivation cells were used for cell
20 toxicity assay mentioned below.

(2) Measurement of cell protective activity of test compounds against β -amyloid 25-35-induced neurotoxicity

After pretreatment of SK-N-SH cells with rhIFN- γ in collagen-coated 96 well multi-plate, cell toxicity
25 assay was started by addition of β -amyloid 25-35 and test compound. Briefly, 80 μ l of culture medium was removed, and 40 μ l of β -amyloid 25-35 and 40 μ l of test compound were added to cultures at the same time.
30 The final concentrations of β -amyloid 25-35 and test compounds were 10 μ M and 1 μ M, respectively.

The test compound was dissolved at 10 mM in dimethylsulfoxide (DMSO) and diluted in DMEM/F12 medium. β -amyloid 25-35 was dissolved at 5 mM in sterile pure
35 water, and stored at -80°C. Immediately before use,

the stock solution β -amyloid 25-35 was diluted in DMEM/F12 medium and sonicated.

(3) Evaluation of cell protective activity of test compound

Cell viability was assessed by the reduction of Alamar Blue™ reagents, 3 days after starting of the cell toxicity assay. Briefly, 20 μ l of culture medium was substituted with 20 μ l of Alamar Blue™ reagents and incubated 4 hours. Absorbances were determined at wavelengths of 570 nm and 600 nm using a plate reader (MTP-32 Micro-plate Reader, manufactured by Corona Co.). Amount of reduced Alamar Blue™ reagents was determined by subtracting absorbance₆₀₀ from absorbance₅₇₀. The cell protective activity of the test compound was estimated according to the following equation:

$$\text{Cell protective activity of compound} = [(A-B)/(C-B)] \times 100 (\%)$$

where;

A: cell viability of the group treated with both the test compound and β -amyloid

B: cell viability of the group treated with β -amyloid only

C: cell viability of the control group

Results

Cell viability of the group treated with both the test compound and β -amyloid was compared with that group treated with β -amyloid only using Dunnett's test. Cell viability of each group was determined using at least 4 culture well. The data obtained are shown in the following Table.

1	30.7
2	27.9
3	39.4
7	27.3
12	44.8
14	44.2
25	47.0

These data verify that compound (I) and compound (Ia) well suppress β -amyloid toxicity.
